

Unit 2 Medication Classes and Prototype Medications

Immunomodulators

Corticosteroids-dexamethasone, prednisone

Calcineurin inhibitors-cyclosporine

Biologic agents

Monoclonal antibodies-trastuzumab

DMARDs-methotrexate, hydroxychloroquine

Biologic DMARDs/TNF blocker-adalimumab

Medications to treat inflammation

NSAIDs

First generation-ibuprofen, aspirin

Second generation-celecoxib

Glucocorticoids-prednisone

Acetaminophen

Antineoplastics

Alkylating Agents

Nitrogen Mustards-cyclophosphamide

Anthracyclines-doxorubicin hydrochloride

Vinca alkaloids-vincristine

Taxanes-Paclitaxel

Folic acid analogs-methotrexate

Estrogen receptor blockers-tamoxifen

Monoclonal Antibodies-trastuzumab

Antibacterials

Tetracyclines-tetracycline

Lincosamides-clindamycin

Sulfonamide derivatives-trimethoprim-sulfamethoxazole

Aminoglycosides-gentamicin

Beta-Lactams-amoxicillin, cephalosporins

Fluoroquinolones-ciprofloxacin

Glycopeptides-vancomycin

Rifamycins-rifampin

Antifungals

Azole derivatives- fluconazole (from notes, not book)

Polyene Macrolides-amphotericin B

Antiparasitic

Antiprotozoal agents-metronidazole

Antivirals

Medications to treat influenza

Neuraminidase inhibitors-oseltamivir phosphate

Medication to treat herpes

nucleoside analogues-acyclovir sodium

Medications to treat HIV

Nucleoside reverse transcriptase inhibitors-zidovudine

Exam 2 Blueprint

Exam Information

- 50 questions
- Multiple choice, select all that apply, matching
- Focus on understanding medication classes, prototype medications, major adverse effects (most common and most severe), and medication safety concepts

Content Distribution

Content Area	Approximate Weight
Immunomodulators	25-30%
Anti-inflammatory medications	15-20%
Antineoplastics	15-20%
Anti-infectives	25-30%
Content from Exam 1	10%

Immunomodulators

You should be able to:

- Explain the purpose of immunomodulator therapy
- Identify common uses of immunomodulators
- Recognize major adverse effects and safety concerns
- Apply client teaching principles
- Recognize key characteristics of prototype medications

Anti-Inflammatory Medications

You should be able to:

- Differentiate major medication classes used to treat pain and inflammation
- Recognize major adverse effects
- Compare similarities and differences among medications in this category
- Apply medication safety principles

Antineoplastics

You should be able to:

- Describe general chemotherapy principles
- Recognize common adverse effects associated with cancer treatment
- Identify major safety concerns
- Recognize key characteristics of prototype medications

Anti-Infectives

You should be able to:

- Differentiate medications used to treat bacterial, fungal, viral, and parasitic infections
- Recognize major adverse effects
- Apply medication teaching principles
- Explain appropriate use of anti-infective medications
- Recognize key characteristics of prototype medications
- Explain principles of antibiotic therapy
